AB To develop a competitive indirect ELISA for metamifop, a new aryloxyphenoxypropionic acid herbicide, three structurally related haptens were synthesized. Hapten conjugates to keyhole limpet hemocyanin and bovine serum albumin were used as immunogens and plate-coating antigens, resp. Various sets of polyclonal antibodies from rabbits and the coating antigens were screened for the assay in simple homologous and heterologous ELISA formats. A selected heterologous ELISA was optimized to show an average IC50 value as low as 20.1 ng/mL, detection ranges of 1.0-350 ng/mL, and a lowest detection limit of 0.1 ng/mL. The cross-reactivities of other aryloxyphenoxypropionic acid herbicides to the antibodies were less than 0.5% in the assays except fenoxaprop-P and fenoxaprop-P Et, having a diaryl ether group identical to that of metamifop. Mol. modeling studies revealed that the physicochem. properties of the diaryl ether group are the most important determinants of sensitivity and selectivity. The results strongly indicate that the selected set of ELISA is a highly sensitive and convenient tool for detecting metamifop.

PRIORITY APPLN. INFO.: US 2005-731044P P 20051028
AB A novel enzyme from Delftia acidovorans that uses 2,4-D and pyridyloxyacetate herbicides as substrates and that can confer plant resistance to these herbicides is identified. The gene is cloned for use in the development of plants resistant to these herbicides. Plants can be made resistant to a wide variety of herbicides by using this gene in combination with one or more other herbicide resistance genes. Use of combinations of herbicide resistance genes can allow the use of complex patterns of herbicides for more effective weed control with a reduced risk of developing herbicide resistance. Cloning of the gene, characterization of the enzyme, and use of a codon-optimized synthetic gene to confer herbicide resistance in Arabidopsis thaliana are demonstrated.

I

AB A herbicide composition useful in rice cultivation contains both I (R1 = C1-3 (halo)alkyl, alkoxyalkyl, Ph, pyridyl; R2 = H, C1-3 (halo)alkyl or alkoxy, halo; R3-R6 = H, (halo)alkyl, etc.; X, Y = C1-3 (halo)alkyl or (halo)alkoxy, halo, dialkylamino; Z = N, CH) and ≥1 compound selected from among dymron, dimepiperate, and esprocarb; a weeding method comprises applying I and ≥1 compound selected from dymron, dimepiperate, and esprocarb either simultaneously or at different times. Herbicide compns. also may contain I and ≥1 other compound such as cinosulfuron, benthiocarb, etc. Thus, I (R1 = Me, R2 = Cl, R3 = Me, R4-R6 = H, X, Y = MeO, Z = CH) at 0.5 g/are was ineffective against Scirpus juncoides, but when the same compound was applied in combination with cafenstrole (2.5 g/are), weed control was ≥90%.

AB Genes for a novel enzyme, a aryloxyalkanoate dioxygenase, that can make a plant resistant to 2,4-D and other phenoxy auxin herbicides, and to aryloxyphenoxypropionate herbicides. Heretofore, there was no expectation or suggestion that a plant with both of these advantageous properties could be produced by the introduction of a single gene. The subject invention also includes plants that produce one or more enzymes of the subject invention alone or "stacked" together with another herbicide resistance gene, preferably a glyphosate resistance gene, so as to provide broader and more robust weed control, increased treatment flexibility, and improved herbicide resistance management options. More specifically, preferred enzymes and genes for use according to the subject invention are referred to herein as AAD (aryloxyalkanoate dioxygenase) genes and proteins. No α-ketoglutarate-dependent dioxygenase enzyme has

previously been reported to have the ability to degrade herbicides of different chemical classes and modes of action. This highly novel discovery is the basis of significant herbicide tolerant crop trait opportunities as well as development of selectable marker technol. The subject invention also includes related methods of controlling weeds. The subject invention enables novel combinations of herbicides to be used in new ways. Furthermore, the subject invention provides novel methods of preventing the formation of, and controlling, weeds that are resistant (or naturally more tolerant) to one or more herbicides such as glyphosate. Characterization of the aryloxyalkanoate dioxygenase encoded by the rdpA gene Ralstonia eutropha is reported. Expression of a codon-optimized synthetic gene for the enzyme in Arabidopsis thaliana resulted in increased resistance to phenoxyauxin herbicides.

AB The invention relates to synergistic herbicidal compns. comprising N-[[(4,6-dimethoxy-2-pyrimidinyl)amino]carbonyl]-2-[2-fluoro- 1 -(methoxymethylcarbony loxy)propyl]-3-pyridinesulfonamide (flucetosulfuron) or N-[[(4,6-dimethoxy-2-pyrimidinyl)amino] carbonyl]-2-[2-fluoro-1-(hydroxy)propyl]-3-pyridinesulfonamide and other known herbicides. The herbicidal compns. of the invention have high efficacy against major weeds, and can reduce the use amount of active ingredients per unit area, due to the synergistic effect by mixing two herbicidal active ingredient having different physiol. functions or different herbicidal activities.

AB Metamifop (coded DBH129, ISO proposed) is a new aryloxyphenoxypropionate (AOPP) post-emergence herbicide. One of the most outstanding features of metamifop is that it shows an exclusive whole plant safety to rice with a high control efficacy to annual grass weeds, especially barnyardgrass. To determine the reason for the selectivity of metamifop, ACCase sensitivity, absorption and translocation of [14C] metamifop in both rice (tolerant) and barnyardgrass (susceptible) were examined The I50 values for inhibition of ACCase by metamifop was >10 μM in rice and 0.5 μM in barnyardgrass. This differential sensitivity is consistent with whole plant sensitivity under greenhouse conditions. More [14C] metamifop was absorbed through the leaf surface in barnyardgrass than in rice, with about 83% and 56% of the total applied [14C] penetrating 72 h after application resp. Translocation was not significantly different between the two species. Thus, the selectivity of metamifop between rice and barnyardgrass could be due to both differential foliar absorption rate and differential ACCase sensitivity.

LANGUAGE: English
AB Metamifop [DBH-129, (R)-2-[4-(6-chloro-1,3-benzoxazol-2-yloxy)phenoxy]-2'-fluoro-N-methylpropionanilide] is a new aryloxyphenoxypropionate (AOPP) herbicide being developed by Dongbu Hannong Chemical Co Ltd, Korea. Like other AOPPs, metamifop provides excellent control on a wide range of

annual grass weeds. However, unlike other AOPPs, it shows robust safety on rice. Applied post-emergence in paddy and direct-seeded rice cultivation, metamifop at the rates of 90-200 g a.i./ha gives excellent control of the major grass weeds including Echinochloa spp., Leptochloa chinensis, Digitaria spp. and Eleusine indica. Diverse field trials have been conducted globally to register metamifop both as 3.3-10% EC and as 0.67-1.6% GR formulation for rice cultivation in Asia regions, including Korea and Japan. Metamifop has a favorable toxicol., ecotoxicol., and environmental profile.

LANGUAGE: English
AB To develop a competitive indirect ELISA for metamifop, a new aryloxyphenoxypropionic acid herbicide, three structurally related haptens were synthesized. Hapten conjugates to keyhole limpet hemocyanin and bovine serum albumin were used as immunogens and plate-coating antigens, resp. Various sets of polyclonal antibodies from rabbits and the coating antigens were screened for the assay in simple homologous and heterologous ELISA formats. A selected heterologous ELISA was optimized to show an average IC50 value as low as 20.1 ng/mL, detection ranges of 1.0-350 ng/mL, and a lowest detection limit of 0.1 ng/mL. The cross-reactivities of other aryloxyphenoxypropionic acid herbicides to the antibodies were less than 0.5% in the assays except fenoxaprop-P and fenoxaprop-P Et, having a diaryl ether group identical to that of metamifop. Mol. modeling studies revealed that the physicochem. properties of the diaryl ether group are the most important determinants of sensitivity and selectivity. The results strongly indicate that the selected set of ELISA is a highly sensitive and convenient tool for detecting metamifop.

AB A novel enzyme from Delftia acidovorans that uses 2,4-D and pyridyloxyacetate herbicides as substrates and that can confer plant resistance to these herbicides is identified. The gene is cloned for use in the development of plants resistant to these herbicides. Plants can be made resistant to a wide variety of herbicides by using this gene in combination with one or more other herbicide resistance genes. Use of combinations of herbicide resistance genes can allow the use of complex patterns of herbicides for more effective weed control with a reduced risk of developing herbicide resistance. Cloning of the gene, characterization of the enzyme, and use of a codon-optimized synthetic gene to confer herbicide resistance in Arabidopsis thaliana are demonstrated.

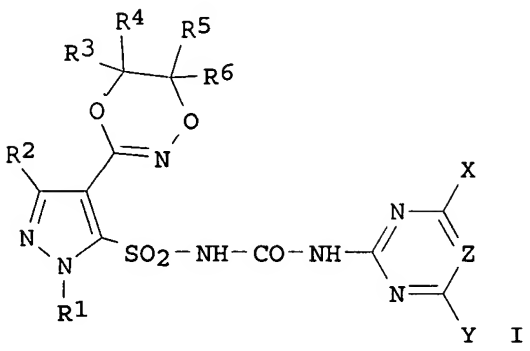
Case 10509635

GI



AB A herbicide composition useful in rice cultivation contains both I (R1 = C1-3 (halo)alkyl, alkoxyalkyl, Ph, pyridyl; R2 = H, C1-3 (halo)alkyl or alkoxy, halo; R3-R6 = H, (halo)alkyl, etc.; X, Y = C1-3 (halo)alkyl or (halo)alkoxy, halo, dialkylamino; Z = N, CH) and ≥1 compound selected from among dymron, dimepiperate, and esprocarb; a weeding method comprises applying I and ≥1 compound selected from dymron, dimepiperate, and esprocarb either simultaneously or at different times. Herbicide compns. also may contain I and ≥1 other compound such as cinosulfuron, benthiocarb, etc. Thus, I (R1 = Me, R2 = Cl, R3 = Me, R4-R6 = H, X, Y = MeO, Z = CH) at 0.5 g/are was ineffective against Scirpus juncoides, but when the same compound was applied in combination with cafenstrole (2.5 g/are), weed control was ≥90%.

AB Genes for a novel enzyme, a aryloxyalkanoate dioxygenase, that can make a plant resistant to 2,4-D and other phenoxy auxin herbicides, and to aryloxyphenoxypropionate herbicides. Heretofore, there was no expectation or suggestion that a plant with both of these advantageous properties could be produced by the introduction of a single gene. The subject invention also includes plants that produce one or more enzymes of the subject invention alone or "stacked" together with another herbicide resistance gene, preferably a glyphosate resistance gene, so as to provide broader and more robust weed control, increased treatment flexibility, and improved herbicide resistance management options. More specifically, preferred enzymes and genes for use according to the subject invention are referred to herein as AAD (aryloxyalkanoate dioxygenase) genes and proteins. No α-ketoglutarate-dependent dioxygenase enzyme has previously been reported to have the ability to degrade herbicides of different chemical classes and modes of action. This highly novel discovery is the basis of significant herbicide tolerant crop trait opportunities as well as development of selectable marker technol. The subject invention also includes related methods of controlling weeds. The subject invention enables novel combinations of herbicides to be used in new ways. Furthermore, the subject invention provides novel methods of preventing the formation of, and controlling, weeds that are resistant (or naturally more tolerant) to one or more herbicides such as glyphosate. Characterization of the aryloxyalkanoate dioxygenase encoded by the rdpA gene Ralstonia eutropha is reported. Expression of a codon-optimized synthetic gene for the enzyme in Arabidopsis thaliana resulted in increased resistance to phenoxyauxin herbicides.
